This study was conducted to identify methods that have been used in the repair and rehabilitation of concrete dams. Information was obtained through literary searches, discussions with project personnel, and visits to project sites. Each case history includes a background of the project, the deficiency that necessitated repair or rehabilitation, and descriptions of materials and methods used in the repair or rehabilitation. When available, the cost of the repair project and the performance of the repair to date have been included. Case histories included in this report cover a range of deficiencies in concrete structures, including cracking, spalling, erosion, leakage, inadequate PMF capacity, expansion resulting from alkali-aggregate reaction, instability, and insufficient storage capacity.

Concrete is an inherently complex material to produce and an even more complex material to repair. With growing pressure to maintain the built environment, and not simply to demolish and rebuild, the need to repair concrete buildings and other structures is increasing and is expected to become of greater importance in the future. This straightforward book serves as a practical guide to engineers on the processes to be followed in commissioning a concrete repair. It stresses the need to fully understand the cause, extent and location of the problem, by appropriate insitu and laboratory testing. And it outlines the steps to a successful repair. It includes sections on the different repair techniques, giving good practical advice as to where and when to use them, and the warns of the pitfalls of their incorrect use. It also includes an up-to-date guide on the current standards for repair, and provides a good bibliography on other sources of information and books on the various techniques.

Introduced in the United States as a new material for statuary in the mid-nineteenth century, zinc has properties that allowed replication at low cost. It was used to produce modestly priced serial sculpture displayed throughout the nation on fountains, public monuments, and war memorials. Imitative finishes created the illusion of more costly bronze, stone, or polychrome wood. This first comprehensive overview of American zinc sculpture is interdisciplinary, engaging aspects of art history, popular culture, local history, technology, and art conservation. Included is a generously illustrated catalogue presenting more than eight hundred statues organized by type: trade figures and Indians, gods and goddesses, fountain figures, animals, famous men, military figures, firemen, cemetery memorials, and religous subjects. The compilation of data on these statues will be valuable to scholars, filling the current void in research libraries. The author's experience as a conservator will also make the an essential resource for historic preservationists seeking to repair statues now damaged by years of outdoor exposure. This book has 555 illustrations, 354 of which are in color. Carol Grissom is Senior Objects Conservator at the Smithsonian's Museum Conservation Institute.
